

The 3rd ENEA Workshop took place in Tel Aviv, Israel, on December 1-3, 2013. The workshop was devoted to the theme 'HYPOPITUITARISM'.

The workshop was a great success and was attended by over 260 participants from over 30 countries around the world including 43 invited speakers and chairpersons. The workshop was supported by educational grants from 10 international and Israeli pharmaceutical companies involved in the field of pituitary diseases and hypopituitarism.

The workshop included state of the art presentations on etiology, genetics, epidemiology, morbidity and mortality, GH deficiency, ACTH-cortisol deficiency, secondary hypogonadism, diabetes insipidus, and uncommon etiologies of hypopituitarism. Current and new treatments in the field of pituitary disease associated with hypopituitarism were discussed, including safety issues.

The workshop included invited presentations, debate, oral communications presented by young investigators, posters, and three pharmaceutical-sponsored symposia. In addition parallel 'meet the expert' sessions were held each morning and there was also a session devoted to the on-going ENEA studies. The scientific program was complemented with a professional exhibition and 2 social events.

Participants enjoyed the very pleasant weather of Tel Aviv, the great location of the congress venue on the shores of Tel Aviv, and the perfect organization by Ellyn Conferences.

Thanks to the ENEA executive committee, the WSC and all active participants who made this workshop so successful.
